

Familiar Guest — Product Roadmap

Phase 2 and later — what is designed-in but ships after the Trusted-Guest-Mode launch

This roadmap tracks every capability that is **not** part of the launch product. The launch scope (Trusted-Guest Mode: owner verifies → lists → guest books → signs → pays into escrow → messages → owner paid after check-in, with lodging-tax line items and iCal sync) is defined in `docs/architecture/full-solution-design.md`. Items here are sequenced after that ships.

How phases are used: **PHASE 2** is the first wave after launch — expansion of the core money/trust product and low-cost differentiators. **PHASE 3** is deeper integration work that depends on Phase-2 data being live and stable. **LATER** is gated on an external condition (counsel, a funded reserve, or volume) and is not yet scheduled.

Phase 2 — first wave after launch

Capability	Notes / dependency
Public Mode — Gate 2 ownership verification, Verified-Owner badge	Accept stranger bookings; admin-reviewed ownership doc (deed / tax statement / fideicomiso) unlocks <code>mode=public</code>
Guest screening (Truvi) + Protected Booking / damage coverage	Add-on revenue; verify non-US guest-ID coverage
Multi-currency payout + FX	USD payout at launch; add MXN/CAD + transparent FX spread; gated on Mexican counsel
Installments / long-stay	Deposit-now/balance-later for snowbird stays; weekly/monthly rates
Year-end tax exports + consolidated Pro reporting	Per-booking tax breakdown → year-end income & tax statements across all units
Standard accounting file export (Feature A)	Download bookings, income, payouts, and tax as CSV · XLSX · QuickBooks IIF · OFX/QBO (Web Connect) . No third-party dependency — a server-side generator over data we already hold (<code>bookings</code> , <code>booking_line_items</code> , <code>payments</code> , <code>payouts</code> , <code>tax_records</code>). Covers QuickBooks Desktop (IIF/QBO), Xero/other (CSV), spreadsheets (XLSX). One new table (<code>accounting_exports</code>), one signed-download route, one private storage bucket. Ships alongside the year-end tax exports.
SMS / WhatsApp messaging (Twilio)	Email-only at launch; add text + WhatsApp channels to the reminder sequence
AI-translated two-way messaging	EN↔ES owner↔guest threads (Anthropic)
Cloud-photo OAuth import	Google Photos / iCloud / Drive / Dropbox; drag-drop + mobile cover launch
Caretaker portal	Scoped arrivals view (no payments, no full guest list); 5 seats on every plan
One-click rebook + referrals	Post-checkout rebook nudge; trusted-guest referral links
Meta Pixel + CAPI	Stood up only when Meta ad campaigns run; consent-respecting server-side fallback

Phase 3 — deeper integrations (depend on Phase-2 data being stable)

Capability	Notes / dependency
QuickBooks Online API sync (Feature B)	Owner connects QBO via OAuth; each completed booking pushes as a sales receipt/invoice + payment , guest → QBO customer , property → QBO class/location , lodging tax → tax line. Idempotent re-sync. Depends on the booking + payout tables being live and stable (nothing to push before then). New tables: <code>accounting_connections</code> (per-owner OAuth + account/class mapping) and <code>accounting_sync_log</code> (one row per pushed object, idempotent). New surfaces: OAuth connect/disconnect + an account-mapping UI in owner Money/Settings. New routes/jobs: <code>/api/accounting/quickbooks/{connect,callback,disconnect}</code> , <code>webhooks/quickbooks</code> , an <code>accounting-sync</code> cron (retries + token refresh). Secrets: OAuth refresh tokens live in a secret store, never in app tables (no new PII category). Operational load: QBO app review (sandbox→production), rate limits, support-heavy. Candidate Pro-tier differentiator.

Later — gated on an external condition (not yet scheduled)

Capability	Gate
Mexican host-tax withholding & remittance (ISR/IVA → SAT)	Mexican counsel confirms FG's platform-of-record obligation; possible RFC/entity
Mexican electronic invoice (CFDI / factura via SAT)	SAT integration; often required for Mexican guests
Booking guarantee	Do NOT launch until a funded reserve exists and payout rules are written
Additional accounting platforms (e.g. Xero API)	Demand-driven; the Phase-2 file exports already cover Xero via CSV

Last updated: June 2026. Source of truth for launch scope: `docs/architecture/full-solution-design.md`. This roadmap supersedes the inline P2/P3 tags for accounting features, which have been removed from the design doc pending scheduling.
